

Senior Technical Lead

SYSTEMS INTEGRATION · LEGACY MODERNIZATION · SOFTWARE ENGINEERING

I help organizations untangle technical systems that have become difficult to change.

WHEN TO CALL ME

Legacy systems. An important application needs modernizing without disrupting the business that depends on it every day.

Integrations & vendors. Multiple systems or outside vendors have to work together, but the interfaces between them are incomplete, undocumented, or unreliable.

Operations & workflows. Operational processes are trapped in spreadsheets, paper, or disconnected tools, and nobody has the whole picture.

Stalled initiatives. A project is stuck between business requirements and technical execution, and the gap is not closing on its own.

SELECTED RESULTS

Unblocking five engineering teams during a mandatory API migration

INSEGO DMS

T-Mobile retired the SOAP/XML services behind billing, compliance, inventory, and pricing. I built Midpoint, an AWS API Gateway and Lambda layer that translated inconsistent REST endpoints into stable internal contracts for five stalled application teams.

5 TEAMS UNBLOCKED · HARD EXTERNAL DEADLINE · ON TIME

Modernizing a critical platform without stopping the business

FILMPAC

Rather than a third rewrite, I modernized incrementally — Strangler-style migration, federated GraphQL, coordinated legacy and Next.js frontends — and redesigned the data layer across PostgreSQL, DynamoDB, and Algolia.

Replacing warehouse paperwork without replacing the ERP

BLUE MOUNTAIN HAY

An iPad production application with Spanish-language workflows replaced paper capture for labor, lots, waste, scanning, and label printing — integrated through controlled adapters with a vendor ERP offering no API and no database access.

~\$2M ANNUAL FLOW · PAPER → DIGITAL · NO API OR DB ACCESS

Giving managers AI speed without surrendering production control

INDEPENDENT

A governed environment — protected data, shared authentication, source-control discipline, testing, and a manual production gate — let two managers build internal applications directly from their own business knowledge.

HOW I WORK

- 01 Discover.** Learn how the business actually works: interview the people doing it, read the real paperwork, watch the workflow itself.
- 02 Decompose.** Find the boundaries that make the problem manageable. Decide what to preserve, what to isolate, and where complexity should live.
- 03 Build & integrate.** Implement what is missing, integrate what should be retained. I write the production code myself.
- 04 Production.** Stay involved through migration, rollout, training, and adoption. A solution is finished when it is operating.

TECHNICAL TOOLKIT

ENGINEERING

TypeScript · JavaScript · React · Next.js · Node.js · PHP / Laravel · REST · GraphQL · OpenAPI

DATA & SEARCH

PostgreSQL · SQL · DynamoDB · Algolia · Redis · Data modeling · Migration

CLOUD & DELIVERY

AWS Lambda · API Gateway · S3 · ECS / Fargate · EventBridge · Docker · CI/CD

ARCHITECTURE

Systems integration · Legacy modernization · Strangler pattern · Domain-driven design · Performance engineering

ENGAGEMENTS

Consulting. Focused discovery, architecture, troubleshooting, or a defined piece of implementation work.

Embedded contract. Multi-month hands-on delivery inside your team, from discovery through production.

Long-term leadership. Senior technical ownership without adding a permanent executive.
